

THE FACEPLATE

- HEADER** — presets · Bypass · Output trim (−24...+12 dB)
- FILTER** — the Big Dial (11 steps, 18 dB/oct high-pass) + Impedance, Magnetism, Character, Dynamics, Artefacts, Gain. Switches: on/off, Bank B, Post.
- ECHO** — Time, Feedback, Input, Output, Hiss, Mix, Wear. Switches: on/off, Sync, Dub Send.
- MOD** — LFO (5 shapes, free or synced) and envelope follower, both steering the Big Dial in ± 3 octaves.
- SPRING** — Spring (amount), Tension (decay), Drive (crash).

DIAL POSITIONS (HZ)

STEP	1	2	3	4	5	6	7	8	9	10	11
Bank A	70	100	150	220	330	500	750	1.1k	1.8k	3.5k	7.5k
Bank B	50	80	120	170	240	350	520	800	1.3k	2.4k	5.0k

INSTALL

macOS: run `OLIVERB-macOS.pkg` (right-click → Open the first time).
Windows: run `OLIVERB-Windows-Setup.exe` (SmartScreen: More info → Run anyway).
Linux: copy `OLIVERB.vst3` to `~/vst3/`. Then rescan plug-ins — it's under **Deestech**.

SIGNAL FLOW

Pre (default): the echo repeats inherit the dial — sweeps drag the tail. **Post:** the filter carves the finished signal, tails included.

FIRST SOUND IN 60 SECONDS

1. Insert on a drum loop; load preset **Waterhouse Rockers**.
2. Sweep the big **Frequency** dial — hear the corner peak and the clacks.
3. Push **Feedback** past 80 %; the repeats build toward self-oscillation.
4. Tap **Dub Send** — the input stops, the loop keeps circling. Dub-out.
5. Tap it back. Carry on.

The numbers that matter: Feedback unity = **80 %** (beyond it the machine self-oscillates, safely). Echo time **20–2000 ms**, tape-style pitch bend on changes. Mod range **± 3 octaves** around the dial. Output is hard-limited — it cannot run away.

THE FIVE MOVES

Dub throw	Feedback + Mix high. Un-mute one hit, flip <i>Dub Send</i> to hold it, let it circle and decay.
Ride the dial	Filter <i>Pre</i> , sweep Frequency mid-tail — every repeat bends with you. Add <i>Artefacts</i> for the clack.
Pitch-bend echo	Automate <i>Time</i> : small moves warble, big jumps dive-bomb.
Siren	Feedback past unity, no input. Tune with <i>Time</i> , filter with the dial, crash the spring.
Auto-wah	<i>Env Depth</i> positive, step 4–6, Impedance up. Negative depth ducks instead — an ungate.

IF SOMETHING'S WRONG

Not in the DAW	Rescan; check the VST3 folder; macOS: clear quarantine (see manual §2).
Tail never dies	Feedback ≥ 80 % — that's the instrument. Pull it down.
Too loud	Open Impedance + hot feedback adds real level: trim filter <i>Gain</i> or <i>Output</i> .
